## 9. MEDLEY FORGIVENESS: DWIM

DWIM (Do What I Mean) is an Interlisp utility that makes life easier.

 ${\tt DWIM}$  tries to match unrecognized variable and function names to known ones. This allows Lisp to interpret minor typing errors or misspellings in a function, without causing a break. Line 152 of Figure 9-1 illustrates how the misspelled Bannanna was replaced by Banana before the expression was evaluated.

```
Exec (INTERLISP)

151+ (DEFINEQ (PEEL (BANANA) (CDR BANNANNA)))
(PEEL)
152+ (PEEL '(A B D))
BANNANNA {in PEEL} -> BANANA ? Yes
(B D)
153+
```

Figure 9-1. Examples of DWIM Features

Sometimes <code>DWIM</code> may alter an expression you didn't want it to. This may occur if, for example, a hyphenated function name (e.g., (MY-FUNCTION)) is misused. If the system does not recognize the function name, it may think you are trying to subtract "FUNCTION" from "MY". <code>DWIM</code> also takes the liberty of updating the function, so it will have to be fixed. However, this is as much a blessing as a curse, since it points out the misused expression!
