```
Script to check code inspectors on frames
(can be in any package)
```

type cntl-b to cause a break.

Place the mouse in the break window and press the middle button

select `BT`**!**

choose a frame that does not have a \ and select it with the middle button.

When a menu appears choose `InspectCode`

Observe the code window -- it should scroll and allow selections but not allow any changing.

return to the window caused by the BT!

choose a frame that does have a \ and select it with the middle button.

When a menu appears choose `InspectCode`

Observe the code window -- it should scroll and allow selections but not allow any changing.

```
--------------------------------------------
```

return to the window caused by the BT!

select an entry with the left button.

a window will appear that has a title (whatever entry you chose) Frame.

In that window select a element in the left hand column with the left button.

Press the middle button over the same element.
select "`set`**"**

type: `5`

-- the value of the chosen element should become 5

Find a list in the right hand column of the frame window and select it with the left button.
Press the middle button and choose "`inspect`**"**

-- an inspect window with the elements of the list will appear
